Problema 3: Corriente de Noether:

$$\mathcal{J}^\mu = \frac{\partial \mathcal{L}}{\partial(\partial_\mu \phi)} \delta \phi + \frac{\partial \mathcal{L}}{\partial(\partial_\mu \phi^\dagger)} \delta \phi^\dagger$$

$$\therefore \delta \phi = -i\epsilon \theta, \quad \delta \phi^\dagger = i\epsilon \theta$$

$$\frac{\partial \mathcal{L}}{\partial(\partial_\mu \phi)} = \partial^\mu \phi^\dagger \quad \text{y} \quad \frac{\partial \mathcal{L}}{\partial(\partial_\mu \phi^\dagger)} = \partial_\mu \phi$$

$$\therefore \mathcal{J}^\mu = (\partial^\mu \phi^\dagger)(-i\epsilon \theta \phi) + (\partial_\mu \phi)(i\epsilon \theta \phi^\dagger)$$

$$\text{Ahora } \phi^\dagger = \int \frac{d^3 p}{\sqrt{(2\pi)^3 2E_p}} \left(a^\dagger(p) e^{ip \cdot x} + \hat{a}(p) e^{-ip \cdot x} \right)$$

$$\textcircled{1} \partial^\mu \phi^\dagger = \int \frac{d^3 p}{\sqrt{(2\pi)^3 2E_p}} \left(i a^\dagger(p) p^\mu e^{ip \cdot x} - i \hat{a}(p) p^\mu e^{-ip \cdot x} \right)$$

$$\textcircled{2} \partial_\mu \phi = \int \frac{d^3 p}{\sqrt{(2\pi)^3 2E_p}} \left(-i a(p) p_\mu e^{-ip \cdot x} + i \hat{a}^\dagger(p) p_\mu e^{ip \cdot x} \right)$$

Note que si multiplicamos $\partial^\mu \phi^\dagger$ por ϕ y $\partial_\mu \phi$ por ϕ^\dagger

$$(\partial^\mu \phi) \phi^\dagger = \int \frac{d^3 p d^3 p'}{(2\pi)^3} \frac{1}{2\sqrt{E_p E_{p'}}} i p^\mu \left(-a(p) a^\dagger(p') e^{-i(p-p') \cdot x} + \hat{a}^\dagger(p) \hat{a}(p') e^{i(p-p') \cdot x} \right. \\ \left. - a(p) \hat{a}(p') e^{-i(p+p') \cdot x} + \hat{a}^\dagger(p) a^\dagger(p') e^{i(p+p') \cdot x} \right)$$

Similmente:

$$(\partial^\mu \phi^\dagger)(\phi) = \int \frac{d^3 p d^3 p'}{(2\pi)^3} \cdot \frac{1}{2\sqrt{E_p E_{p'}}} i p^\mu \left(a^\dagger(p) a(p') e^{i(p-p') \cdot x} - \hat{a}(p) \hat{a}^\dagger(p') e^{-i(p-p') \cdot x} \right. \\ \left. - \hat{a}(p) a(p') e^{-i(p+p') \cdot x} + a^\dagger(p) \hat{a}^\dagger(p') e^{i(p+p') \cdot x} \right)$$

Ahora, multiplicando por $i q \theta$ o $-i q \theta$ y calculando la expresion para la corriente:

$$J^\mu(x) = i q \theta \int \frac{d^3 p d^3 p'}{(2\pi)^3} \frac{1}{2\sqrt{E_p E_{p'}}} i p^\mu \left[(\hat{a}(p) a^\dagger(p') - a(p) a^\dagger(p')) e^{-i(p-p') \cdot x} \right. \\ \left. + (a^\dagger(p) a(p') - a(p) a^\dagger(p')) e^{i(p-p') \cdot x} + (\hat{a}(p) a(p') - a^\dagger(p) a(p')) e^{-i(p+p') \cdot x} \right. \\ \left. + (\hat{a}^\dagger(p) a^\dagger(p') - a^\dagger(p) a^\dagger(p')) e^{i(p+p') \cdot x} \right]$$

Ahora, para hallar la carga conservada:

$$Q = \int d^3 x J^0(x)$$

Note que van a aparecer terminos de la forma:

$$\begin{aligned}\int d^3x e^{\pm i(p \pm p') \cdot x} &= \int d^3x e^{\pm i(E_p \pm E_{p'}) \cdot t} e^{\mp i(\vec{p} \pm \vec{p}') \cdot \vec{x}} \\ &= (2\pi)^3 e^{\pm i(E_p \pm E_{p'})} \delta^3(\vec{p} \pm \vec{p}')$$

Con esto, podemos simplificar la expresión, ya que resulta sólo una integral sobre d^3p .

$$\begin{aligned}\therefore \int d^3x T^{\mu\nu}(x) &= i q_0 \int d^3p \frac{1}{2E_p} i p^{\mu} [\hat{a} \hat{a}^{\dagger} - a a^{\dagger} + a^{\dagger} a - a^{\dagger} a] + \\ &\quad [(a(p) a(-p) - a(p) \hat{a}(-p)) e^{-2iE_p t} + \\ &\quad (a^{\dagger}(p) a^{\dagger}(-p) - a^{\dagger}(p) a^{\dagger}(-p)) e^{2iE_p t}] \end{aligned}$$

Ahora, para $\mu = 0$; $p^{\mu} = E_p$.

$$\begin{aligned}Q &= i q_0 \int d^3p \frac{i}{2} (\hat{a}(p) \hat{a}^{\dagger}(p) - a(p) a^{\dagger}(p) + \hat{a}^{\dagger}(p) \hat{a}(p) - a^{\dagger}(p) a(p)) + \\ &\quad (\hat{a}(p) a(-p) - \hat{a}^{\dagger}(-p) a(p)) e^{-2iE_p t} + \\ &\quad (\hat{a}^{\dagger}(p) a^{\dagger}(-p) - \hat{a}^{\dagger}(-p) a^{\dagger}(p)) e^{2iE_p t} \end{aligned}$$

• Note que las integrales de los términos exponenciales tienen la siguiente característica:

$$\int d^3p \hat{a}(-p) a(p) e^{-2iE_p t} \quad \xrightarrow{p \rightarrow -p}$$

$$\text{entonces } \int_{\mathbb{R}^3} d^3(-p) \hat{a}(p) a(-p) e^{-2iE_p t} = (-1) \int_{-\mathbb{R}^3} d^3p \hat{a}(p) a(-p) e^{-2iE_p t}$$

$$= \int_{\mathbb{R}^3} d^3p \hat{a}(p) a(p) e^{-2iE_p t}$$

Con esta propiedad, note que las integrales relacionadas con los exponenciales se cancelan. Entonces:

$$Q = \frac{q\theta}{2} \int d^3p \left[a(p) a^\dagger(p) - \hat{a}(p) \hat{a}^\dagger(p) + a^\dagger(p) a(p) - \hat{a}^\dagger(p) \hat{a}(p) \right]$$

$$\text{Como } [a(p), a^\dagger(p')] = \delta^3(\vec{p} - \vec{p}')$$

$$[\hat{a}(p), \hat{a}^\dagger(p')] = \delta(\vec{p} - \vec{p}')$$

$$Q = \frac{q\theta}{2} \int d^3p \left[a^\dagger(p) a(p) + 1 - \hat{a}^\dagger(p) \hat{a}(p) - 1 + a^\dagger(p) a(p) - \hat{a}^\dagger(p) \hat{a}(p) \right]$$

$$Q = q\theta \int d^3p \left[a^\dagger(\mathbf{p}) a(\mathbf{p}) - \hat{a}^\dagger(\mathbf{p}) a^\dagger \right]$$

$$Q = qQ \int d^3p \left[N_a - N_{\hat{a}} \right]$$

Problem 2:

Solomon's $g_{\mu\nu} T^{\mu\nu} = \partial^\mu \phi \partial_\mu \phi - \delta^\mu_\mu \mathcal{L}$.

$$\therefore \partial^\mu \phi = \pi, \quad \delta^\mu_\mu = 4, \quad \text{and } \mathcal{L} = \frac{1}{2} (\partial^\mu \phi \partial_\mu \phi - m^2 \phi^2)$$

$$T^{\mu\nu} = \pi^2 - \frac{1}{2} (\partial^\mu \phi \partial_\mu \phi - m^2 \phi^2)$$

Proof. $\partial^\mu \phi = \pi - \bar{\nabla} \phi$

$$T^{\mu\nu} = \pi^2 - \frac{1}{2} [(\pi - \bar{\nabla} \phi)(\pi + \bar{\nabla} \phi) - m^2 \phi^2]$$

$$T^{\mu\nu} = \frac{1}{2} [\pi^2 + (\bar{\nabla} \phi)^2 + m^2 \phi^2]$$

$$\therefore H = \frac{1}{2} \int d^3x [\pi^2 + (\bar{\nabla} \phi)^2 + m^2 \phi^2]$$

Problem 4 :

$$\mathcal{L} = \frac{i}{2} \bar{\psi} \gamma^\mu \partial_\mu \psi - \frac{i}{2} (\partial_\mu \bar{\psi}) \gamma^\mu \psi - m \bar{\psi} \psi$$

$$\therefore \partial_\mu \left(\frac{\partial \mathcal{L}}{\partial (\partial_\mu \bar{\psi})} \right) = \frac{\partial \mathcal{L}}{\partial \bar{\psi}} ; \text{ note that } \frac{\partial \mathcal{L}}{\partial (\partial_\mu \psi)} = -\frac{i}{2} \gamma^\mu \psi$$

$$\text{y } \frac{\partial \mathcal{L}}{\partial \bar{\psi}} = \frac{i}{2} \gamma^\mu \partial_\mu \psi - m \psi$$

$$\text{com into, terms : } \frac{i}{2} \gamma^\mu \partial_\mu \psi + \frac{i}{2} \gamma^\mu \partial_\mu \psi - m \psi = 0$$

$$(\gamma^\mu \partial_\mu - m) \psi = 0$$

$$\text{Then } J^\mu = \frac{\partial \mathcal{L}}{\partial (\partial_\mu \psi)} \delta \psi + \bar{\psi} \frac{\partial \mathcal{L}}{\partial (\partial_\mu \psi^\dagger)}$$

$$\text{Consider a small transformation } \psi \rightarrow \psi' = e^{-i\beta} \psi$$

$$\text{take } \beta \rightarrow 0 \therefore \delta \psi = -i\beta \psi \quad \text{y}$$

$$\delta \bar{\psi} = i\beta \bar{\psi}$$

$$J^{\mu} = \left(\frac{i}{2} \bar{\psi} \gamma^{\mu} \right) (-i \not{p} \psi) + (i \not{p} \bar{\psi}) \left(-\frac{i}{2} \gamma^{\mu} \psi \right)$$

$$J^{\mu} = \not{p} \bar{\psi} \gamma^{\mu} \psi$$
